PUMP STATIONS

Packaged Pump Stations Fitted - Complete
**Mode Of Operation**

Water enters the pump station from what can be multiple source’s, for example, pumped or gravity fed. As the water level within the chamber rises, float switches situated in the tank at predetermined levels activate the pumps. At initial start-up, pump No. 1 will activate. As the water level within the chamber lowers, so does the float switch. Once the float reaches a pre-set depth within the chamber the pump will automatically turn off. The next time the water level reaches the predetermined level, the controller will alternatively turn on pump No. 2. Then, following activations will alternate between pumps 1 and 2.

**High Water Float**

When this Float is in the Up position, both pumps will come on. The Pump Station will stay in High Water Mode until the High Water Float is in the down position.

**Working Float 1**

Operated the pump’s on and off cycles. It will turn pump 1 on first, and on the next cycle turn pumps 2 on. Following activations will alternate between pumps 1 and 2. Float Up is Pump On. Float Down is Pump Off.

**Low Level Float**

This float will turn pumps off so they do not run dry.

**Extras**

- Battery Back-Up Alarm
- Earth Leakage
- Fault Diagnostics
- External Visual Alarm
- Telemetry alarm can be fitted if required.
